Question 1 | Correct Mark 1.00 out of 1.00

Problem Statement:

Given a sorted array of integers say arr[] and a number x. Write a recursive program using divide and conquer strategy to check if there exist two elements in the array whose sum = x. If there exist such two elements then return the numbers, otherwise print as "No".

Note: Write a Divide and Conquer Solution

Input Format

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Sum Value

Output Format

First Line Contains Integer – Element1

Second Line Contains Integer – Element2 (Element 1 and Elements 2 together sums to value "x")

Answer: (penalty regime: 0 %)

```c
#include <stdlib.h>

int findTwoSumRecursive(int arr[], int low, int high, int x, int *num1, int *num2) {

    if (low >= high) {
        return 0;
    }

    int current_sum = arr[low] + arr[high];
    if (current_sum == x) {
        *num1 = arr[low];
        *num2 = arr[high];
        return 1;
    }

    if (current_sum < x) {
        return findTwoSumRecursive(arr, low + 1, high, x, num1, num2);
    }

    else {
        return findTwoSumRecursive(arr, low, high - 1, x, num1, num2);
    }
}

int main() {
    int n;
    if (scanf("%d", &n) != 1 || n < 2) {
        printf("No\n");
        return 0;
    }

    int *arr = (int *)malloc(n * sizeof(int));
    for (int i = 0; i < n; i++) {
        scanf("%d", &arr[i]);
    }

    int x;
    scanf("%d", &x);

    int num1, num2;
    if (findTwoSumRecursive(arr, 0, n - 1, x, &num1, &num2)) {
        printf("%d\n", num1);
        printf("%d\n", num2);
    } else {
        printf("No\n");
    }

    free(arr);
    return 0;
}
```

	Input	Expected	Got	
✔	4 2 4 8 10 14	4 10	4 10	✔
✔	5 2 4 6 8 10 100	No	No	✔

Passed all tests! ✔

Correct

Marks for this submission: 1.00/1.00.
